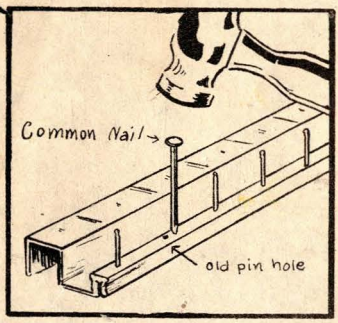
It's So easy to replace a pin on

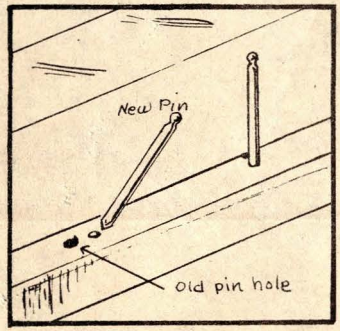
a **Quaker** metal stretcher

1.



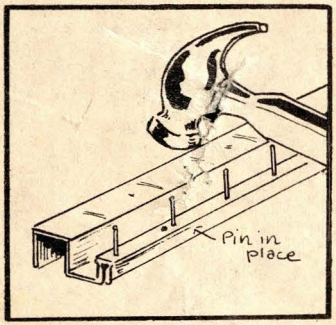
Use a common nail to pierce a small hole about the size of a pin next to the old pin hole. Don't try to put the new pin in the old hole.

2.



Then insert the pointed end of the pin into the hole like this.

3.



Gently tap on the head of the pin until it is firm in the metal and the same height as the rest of the pins.

A coat of colorless nail polish will help preserve the finish.

A small package of replacement ball-point pins are available for 25¢ (stamps or coins).
